Demonstration Trojan Horse

Team Orange

What is it?

A trojan horse is an application that sits on a "victims" computer that sends information back to some remote server.

Our application will send the information to the user via a web interface so the "Victim" can see what kinds of information a trojan horse could scrape from them

Problem to solve

The problem that we are attending to is phishing scams among students. We are developing an application that will help users become more aware of what is possible and to raise skepticism towards phishing scams. Only 47% of people aged 18-22 know what phishing is, so the goal is to raise awareness of the issue by showing its potential for harm

Our implementation
